Hammer stick + head – laser cut

Only the stick and the head are wood. They are **2 flat shapes**: send the files below and tell the laser shop the thickness of each. The outside sizes are the same as before: stick 20 × 15, head 64 × 25 × 30. The motor upright, the hub and the stop posts are **3D printed** (stl/P7 hub, P8 upright, P9 / P10 stop posts).

Send to the laser shop

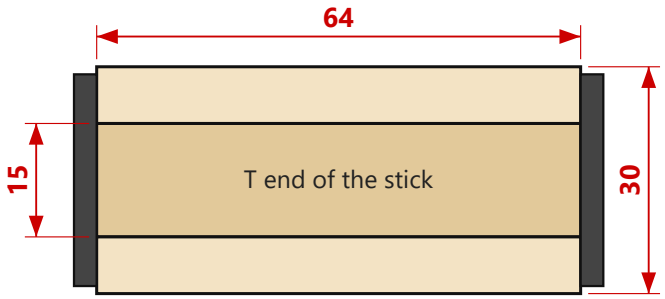

File (SVG or DXF)	Thickness	How many
laser/Hammer_stick_T_15mm	**15 mm**	**1**
laser/Hammer_head_side_plate_7.5mm	**7.5 mm**	**2** (both are in the file)

Material	plywood or hardwood – all pieces the same
Scale	1:1, units mm – import **without scaling**
Lines	all lines are cut-through lines (layer CUT in the DXF, red in the SVG)
Check	the stick T must measure **222.5 mm** long and **20 mm** wide

If 7.5 mm is not available: 8 mm works too (the head becomes 31 wide).

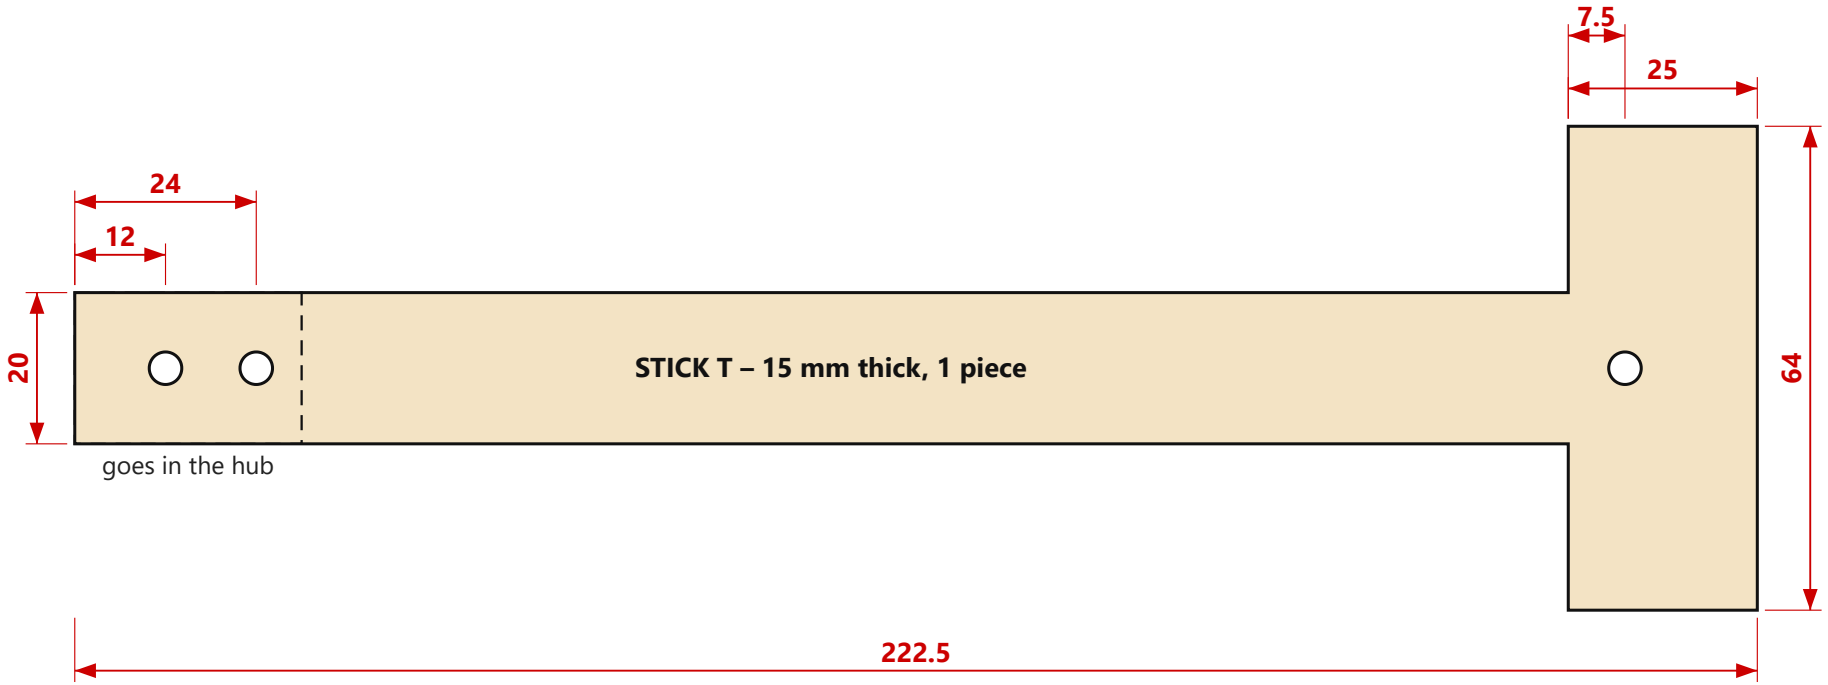

Also needed

Wood glue (or epoxy)	–
M4×35 + nyloc	3 – hub → stick (2), through the head (1)
Rubber / TPU pad 28 × 23 × 3	2 – one on each end of the head

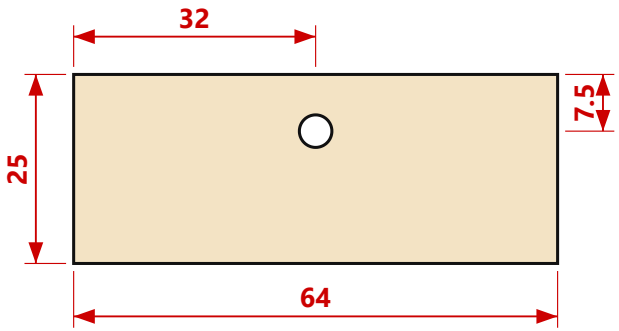

head from below: plate + stick + plate, rubber pad on each end

The 2 shapes (real size at 100 %) and gluing

all holes Ø4.3 · the head hole is on the centre line

SIDE PLATE – 7.5 mm thick, 2 pieces

1. Glue the 2 **side plates** on both sides of the wide end of the stick T. Push an M4 bolt through the 3 holes to line them up, clamp, let dry. The head is now **64 × 25 × 30**.
2. When dry: **M4×35 + nyloc** through the head. Sand the edges.
3. Glue a rubber pad on each 25 × 30 end of the head.
4. Top 30 mm of the stick into the printed hub slot (15 × 20) with epoxy, **2 × M4×35** through hub + stick.

☐ Stick slides into the hub slot without forcing.

☐ The side plate holes line up with the head hole of the stick.
